

# The Digital Object Architecture and the e-APP

Christophe Blanchi  
DONA Foundation

10<sup>th</sup> International Forum on e-App  
The Hague, November 1<sup>st</sup>

# Motivations for the Digital Object Architecture

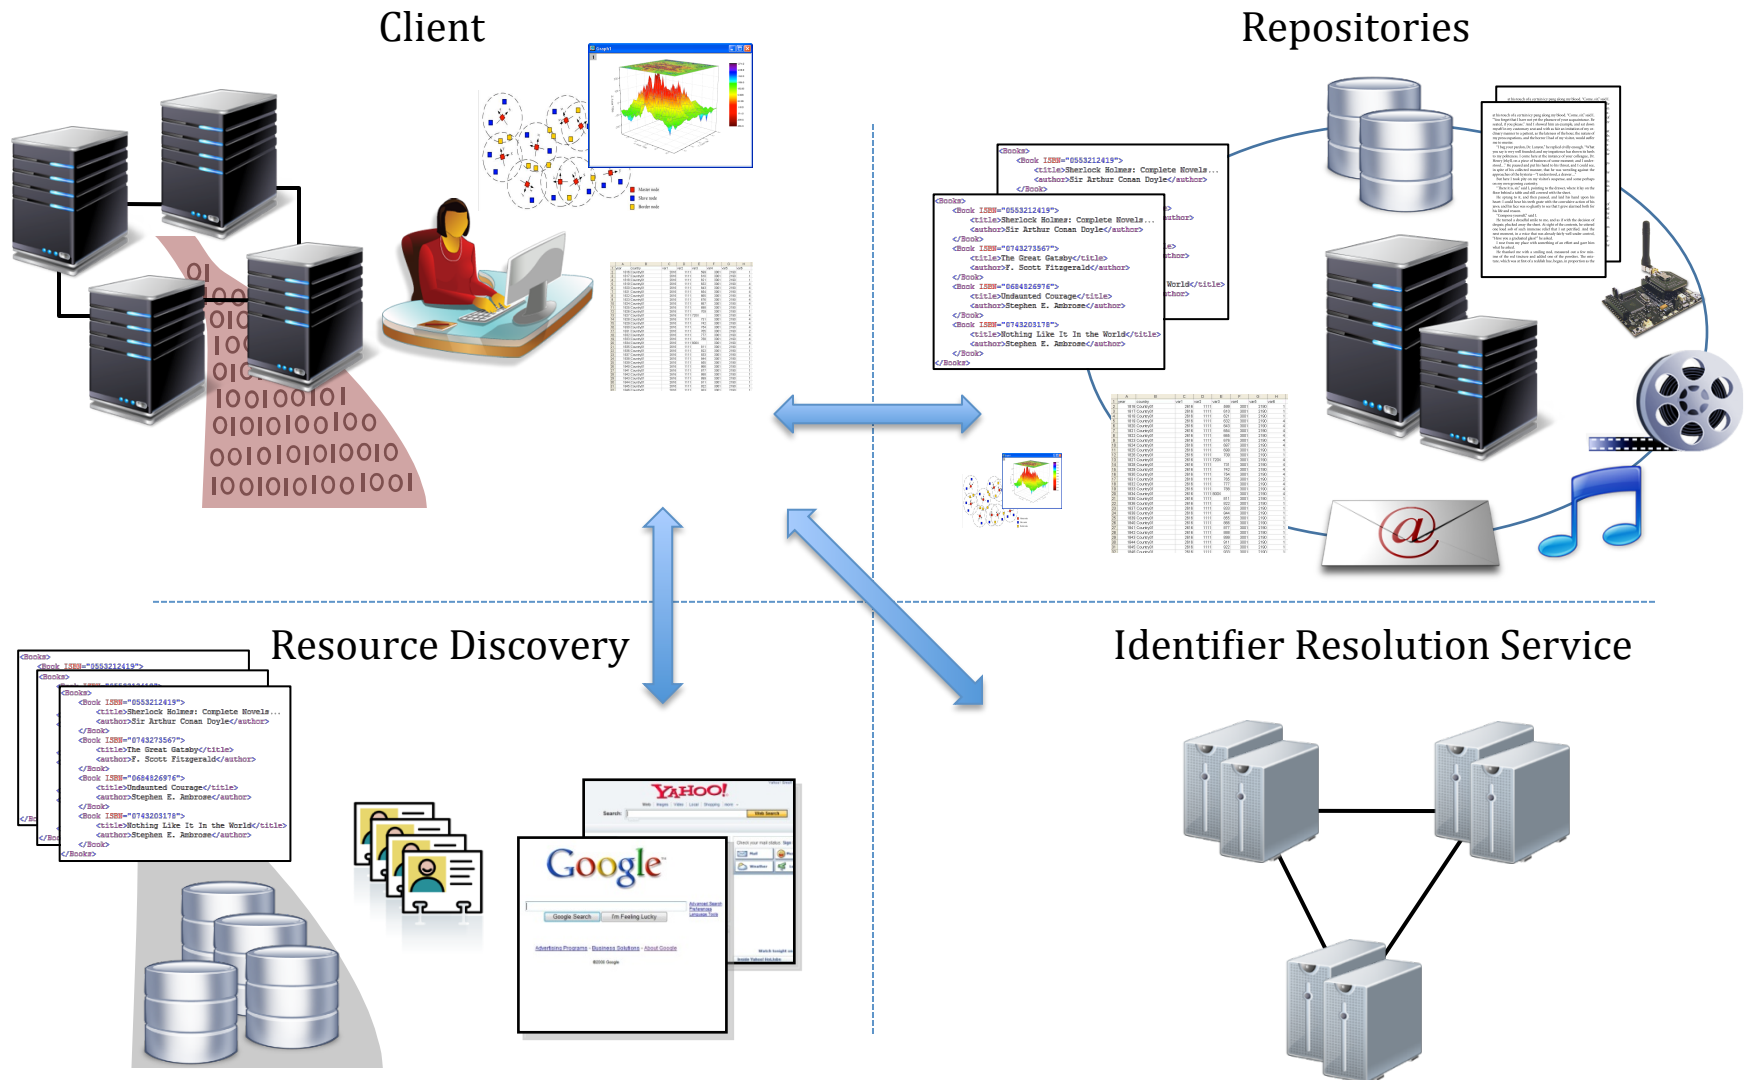

- The Internet is about sharing information represented in digital form.
- Information is more than packets.
- Information needs to be a “First Class Citizen” in the Internet.
  - Information is complex, it has context, uses, monetary value, etc...
  - Information needs to be locatable.
  - Information needs to be understandable and reusable.
  - Information needs to be protected, secured, authenticated, and trusted.
  - Information needs to be able to originate from many different types of sources and systems.
  - Information needs to persist over time.
- The Web enabled wider access to information in the Internet, but there are many issues that remain when dealing with information management.
  - Heterogeneous data and systems such as Big Data and IoT.

# Digital Object Architecture Overview

The Digital Object Architecture addresses the following digital information management issues:

- Uniform and interoperable access to heterogeneous information and services.
  - Identification
  - Description, search and retrieval
  - Typing of data and services
- Interoperability across heterogeneous information systems.
  - Independent of the specific underlying technologies that host and provide the information.
  - Ability to deal with information that is not digital in nature.
- Integrated security.
- Very large level of scalability.
  - Distributed architecture
  - Open architecture framework
  - Standard protocols and procedures

# Digital Object Architecture: Information Management on Networks

### *Search Engines, Metadata Databases, Catalogues, Registries, etc.*

# The Handle System <sup>TM</sup>

- A basic identifier/resolution system for the Internet.
  - Resolves a digital object's identifier to that object's current state information
  - Identifier persists when location and other attributes of the object changes.
- Logically a single system, but physically and organizationally distributed.
- Highly scalable.
- Associates one or more typed values, e.g., IP address, public key, URL, metadata, to each identifier.
- Secure resolution and administration.
- Optimized for speed and reliability.
- Open, well-defined protocol and data model, IPR free.
- Provides infrastructure for a wide application domain, e.g., digital libraries & publishing, e-research, id mgmt, and IoT, etc...

# The Handle System Security Features

- Authentication
  - Using an optional PKI capability.
  - Handle server and client authentication.
- Authorization
  - Handles and associated handle records are administered by authenticated and authorized digital entities such as a handle service providers.
  - A handle service can restrict access to any of its values in a handle record.
- Confidentiality
  - All handle requests and responses can be encrypted.
- Non-Repudiation and Integrity
  - Handle record responses may be signed by the hosting server
  - Handle records may be signed by any authorized administrator.
- Audit logs
  - All Handle servers log all accesses.

# What is a Handle?

35.1234/12345678

The diagram shows a handle '35.1234/12345678'. The part before the slash, '35.1234', is labeled 'Prefix' and is underlined with a blue bracket. The part after the slash, '12345678', is labeled 'Suffix' and is also underlined with a blue bracket. The labels 'Prefix' and 'Suffix' are in red text.

- Handles are globally unique and resolvable
  - Prefixes are allotted to local handle service providers and most prefix handle records are currently stored in the “Global Handle Registry” (GHR).
  - A **handle prefix** is typically resolvable by the GHR to an IP address for a handle resolution service such as a **Local Handle Service**.
  - The **full handle** is resolvable by the **handle resolution service** into a **handle record**.
- Character Set: Unicode 2.0
- Encoding: UTF-8
- Prefix: Currently allocating only numeric values.

# Handle Record

HS\_PUBKEY

0000000B4453415F5055425F4B455900000000015009760508F15230B....

HS\_SIGNATURE

eyJhbGciOiJSUzI1NiJ9.eyJkaWdlc3RzIjp7ImFsZyI6ImlIQS0yNTYiLCJkaWdlc....

Data Types are also resolvable handles and can be specific to:

- The Handle System (\*)
  - **HS\_ADMIN**
  - **HS\_PUBKEY**
  - **HS\_SIGNATURE**
  - **URL etc...**
- An application or service
  - **10320/loc**
- A group/community
- A device type

Types should be identified with a handle and resolve to a type description.

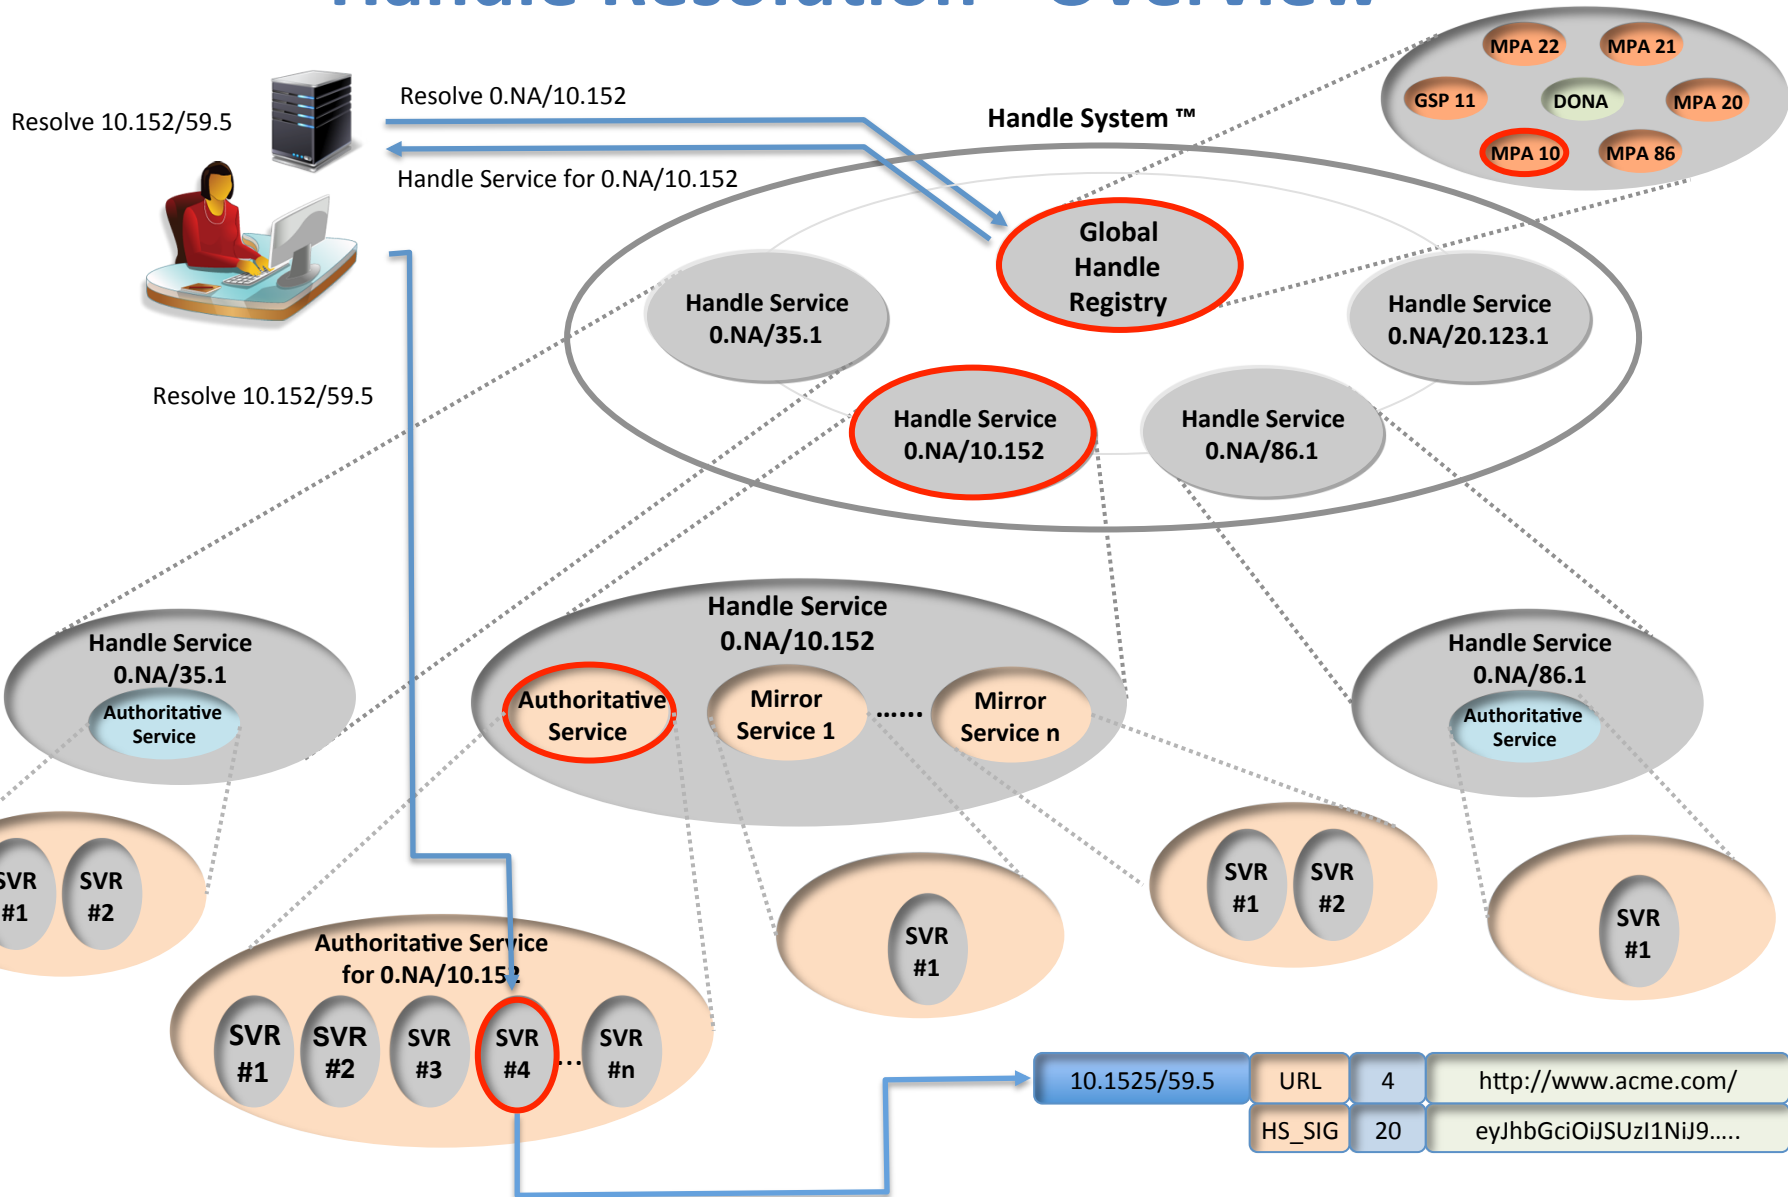

(\*) Handle System types are registered as handles starting with the "0.TYPE/" prefix. (URL -> 0.TYPE/URL)

# Handle Resolution - Overview

Resolving any handle such as 35.152/59.5 is a two step process:

- 1) Find the Handle Service associated with the handle prefix 35.152
  - Access the handle services provided by one of the GHR service providers.
  - Resolve 0.NA/35.152 into its service information.
- 2) Resolve the 35.152/59.5 handle into its respective values
  - Access the handle services for that particular handle at that particular Handle Service provider.
  - Resolve 35.152/59.5 into its handle record.

# Handle Resolution - Overview

# Handle Resolution - Service Info Request

Request: Resolve 10.152/59.5

1. Client requests a specific GSP in the GHR to resolve the prefix handle 0.NA/10.152

## Security Features:

- **Privacy:** Encrypted client request
- **Authentication:**
  - Cryptographic authentication of the target GSP service
  - Cryptographic authentication of the resolving client
- **Audit trail:** GSP logs the full client request

# Handle Resolution - Service Info Request

Client receives the Service Information for the 10.152 Service.

2. The targeted GSP Responds with the Service Information for the 10.152 service.

Handle Service Information

## Security Features

- **Privacy:** Encrypted client request
- **Authentication:**
  - Cryptographic Authentication of the target GSP service
  - Cryptographic Authentication of the resolving client
- **Audit trail:** GSP logs the full client request
- **Privacy:** Response from GSP is encrypted
- **Authorization:** Response only provides what the authenticated client is allowed to see
- **Non-repudiation:** Service information is signed by the GSP service and it is verified by the client.

## Security Features

- **Privacy:** Encrypted client request
- **Authentication:**
  - Cryptographic Authentication of the target LHS service
  - Cryptographic Authentication of the resolving client
- **Audit trail:** LHS logs the full client request

# Handle Resolution – Handle Service Request

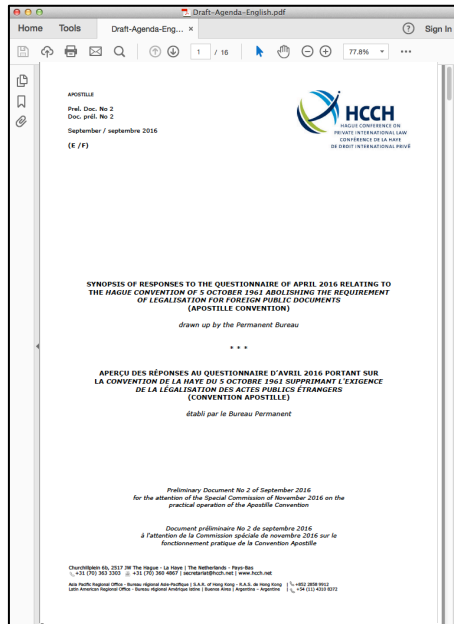

- Security Features**
- **Privacy:** Encrypted client request.
  - **Authentication:**
    - Cryptographic Authentication of the target LHS service.
    - Cryptographic Authentication of the resolving client.
  - **Audit trail:** LHS logs the full client request.
  - **Privacy:** Response from Mirror is encrypted.
  - **Authorization:** Response only provides the values that the authenticated client is allowed to see.
  - **Non-repudiation:** Handle record is signed by the Mirror Service and can be verified by the client.

# Handle and e-APP Synergy

- The need for authenticating digital resources is a basic requirement in many different information industries.
  - Journal articles, medical taxonomies, assets registries.
  - Internet of Things, Big Data.
- The policies and workflows that result in the signing and certifying of digital resources may differ but the intents and process for verifying signature(s) and the signer(s) are similar.
- The Handle System provides an open solution that offers
  - Security, scalability.
  - Interoperability.
  - Digital sovereignty.
  - Signer identification using handles.

# Relationships Between Documents

# Handle Enhanced Document Validation

1. Resolves the document's Handle from PDF metadata
2. Extracts the document's handle metadata.
3. Verifies the PDF's and Handle's signature:
  - Correlates the document to the handle.
  - Confirms the integrity of the document.
4. Validates the identity of the document signer.
  - Who endorsed the signer?
  - Is the signer's certificate valid?
  - Is the signer still recognized?
5. Provides a list of related documents:
  - Next – Previous.
  - References
  - Other languages etc...
6. Lists and verifies all additional cryptographic endorsements.
7. Each endorsement certificate chain can be explored.

# Additional Benefits of the Handle Approach

1. PDF documents enhanced with a handle based verification solution can be used with any technology that can resolve handles such as:
  - An Adobe Reader plugin.
  - A web based solution.
  - Within a Digital Object based solution.
2. The handle based document validation solution can be used to authenticate documents that are not PDFs:
  - Web Pages, Word documents, data sets, etc...
3. Documents are assigned handles that are stored in a Local Handle Service (LHS)
  - The LHS is managed locally.
  - The LHS and registration can follow required local policies and procedures.
  - All handles are globally resolvable and interoperable.
4. Handle resolution provides an efficient solution for inspecting certificate chains
  - Provides a dynamic mechanism for inspecting and verifying certificates.
  - Resolves a signer's ID into its associated public key and metadata.
  - Equally verifies local, regional, and global certificates.

# Who is responsible for operating the GHR?

- The original GHR was operated by CNRI in Reston VA in the US since the mid to late 1990s.
- Until recently, CNRI had the sole credential and authorization to create all new prefixes.
- CNRI decided further enhance and develop the GHR architecture to enable multiple organizations to coordinate and administer the GHR on a multi-primary basis under the overall administration of the DONA Foundation.
- The current GHR maintains backwards compatibility with all legacy handle clients.

# Providers of GHR Services

- An organization that is credentialed and authorized by DONA to create derived prefixes from its allotted credential prefix is known as a Multi-Primary Administrator (MPA) or more generally as a Global Handle Service Provider (GSP).
- Each such organization is allotted a credential (e.g. 0.NA/21) by DONA and authorized to provide GHR services.
- Each such organization can create an unlimited number of derived prefixes from its credential prefix and allot them to organizations that wish to provide local handle services.
- All GHR Services verify and replicate any and all valid prefixes created/modified by other from all other MPAs and GSPs in accordance with DONA Foundation Policies and Procedures .

# The Role of the DONA Foundation

- Based in Geneva Switzerland.
- Maintains the operations of the GHR, collaboratively with all MPAs.
- Provide coordination, software, and other strategic services for the technical development, evolution, application, and other uses in the public interest around the world of the Digital Object Architecture (DOA) with a mission to promote interoperability across heterogeneous information systems.
- DONA will promote the X.1255 standard and the use of the DOA across many different countries, domains, and industries.
- Make the developed DOA standards and/or software accessible to the community to further their development and adoption.
- Enables the development of relevant standards, and software for purposes of reference models and in connection with the GHR

# DONA Foundation's GHR Operations

- DONA coordinates with the GHR Service providers to maintain the stable and secure operation of the the GHR in the public interest.
- DONA credentials and authorizes new MPAs.
- The DONA Foundation will work in collaboration with the MPAs to improve the architectural, technical, and performance of the GHR.
- The Multi-Primary GHR Operations started on the 9<sup>th</sup> of December 2015.

# Questions?
